AI Customer Support Assistant

Problem Statement:

Small businesses get the same customer questions again and again (pricing, refund policy, delivery time), and a human has to answer each one. Generic chatbots give wrong answers because they know nothing about the business. Build a platform where a business uploads its own documents and gets an AI assistant that answers customer questions only from those documents.

Concept:

A web app where a business owner uploads documents (FAQs, policies, product details) and gets a chat page for customers. When a customer asks a question, the system finds the most relevant parts of the documents and sends them to an LLM, which writes the answer. If the answer is not in the documents, the assistant says it doesn't know and logs the question for the owner.

Key Features:

- **Authentication:** User registration and login with two roles, Business Owner and Customer (chat access can also be public through a shareable link).
- **Knowledge Base:** Owner uploads documents (PDF, DOCX, or TXT), and the content is extracted and split into chunks.
- **Relevant Search:** For each question, find the most relevant chunks using embeddings or keyword search.
- **AI Answers:** The LLM answers using only the retrieved chunks and shows which document the answer came from.
- **Unknown Handling:** If the answer is not in the documents, show a polite "I don't have this information" message, and do not make up an answer.
- **Chat History:** Store conversations, and let the owner view them.
- **Unanswered Questions:** Owner sees a list of questions the AI could not answer.
- **Manage Documents:** Owner can update or delete documents, and answers should reflect the change.
- **Dashboard:** Show total chats, total questions, and answered vs unanswered count.

Evaluation Criteria:

- ✓ Document upload and content extraction working correctly
- ✓ Relevant chunk retrieval, with answers coming only from the uploaded documents and the source shown
- ✓ No made-up answers when the information is missing, and correct handling of API failure
- ✓ Owner can see chat history and unanswered questions, with each business seeing only its own documents and chats
